

ISP Services

DMGi can offer one or a combination of services to suit your particular requirements. Shared hosting is geared towards smaller websites which can be migrated to a dedicated platform in the future if necessary. All of our shared system infrastructure is clustered with redundant servers available, so in the case of hardware failure all services will continue to run smoothly.

Our shared hosting offers a choice of Microsofts Internet Information System (IIS) version 6 on Windows Servers or Apache version 2 on Linux Servers. We offer ASP or PHP based hosting and a choice of either Microsoft SQL Server or MySQL databases.

- Website hosting, shared servers supporting both Microsoft and Linux (LAMP) environments
- Database hosting (MySQL/MSSQL)
- Domain name management
- POP3 and IMAP email
- dSpam - Virus scanning / Spam scanning
- Dial Up analogue access for anyone
- Email and Web forwarding
