

Data Centre :: What is a Private Server?

We use high quality PowerEdge servers with a range of configurations to suit every need, allowing you to choose a server capacity and feature list to suit your specific requirements.

As part of the service we keep standby equipment ready in the data centre to be used in the event of a major failure of any server. This means that if, for example, your server was to suffer a major hardware failure we would be able to swap the disks into a spare chassis and have the server up and running again very rapidly and with minimal disruption.

In addition to that, all of our physical servers are monitored by our automated test harness and technicians will be alerted to an issue and will respond or schedule recovery at your earliest convenience.

We offer you your choice of operating systems

- Centos (our recommendation)
- Fedora Core
- Windows 2003 server (web edition).

A fully dedicated server could be used to host resource-intensive and highly active web sites, host corporate email, or to resell and host thousands of web sites.

If you think that you may not need to full resources of a completely dedicated server, then you should take a look at our very low cost Virtual Private Server or call us to discuss your requirements.
